

IGC-HB and IGC-HB/3N1

Operating Instructions

DESCRIPTION

SOMFY'S IGC-HB (Cat. No. 6300030) provides control of one or more motors in groups and/or individually from one or more locations. The IGC-HB/3N1 (Cat. No. 6300035) can be used for those jobs that call for controlling three or more motors individually or in groups.

The IGC-HB and IGC-HB/3N1 are specifically designed to provide lift and tilt capability for horizontal blind applications. They are completely compatible with Somfy's standard IGC, so wiring and basic operation are similar. However, the IGC-HB and IGC-HB/3N1 DO NOT support the AUTO function that the standard IGCs have. For this reason, it is recommended that only MASTER style switches be used.

INDIVIDUAL MOTOR OPERATION

A single motor can be controlled from its corresponding switch. To activate the lift function, momentarily depress the button (less than one second) corresponding to the desired direction. During this action, the motor can be stopped in any position by

pressing the STOP button. To tilt the window treatment, simply press and hold either directional button. When the desired angle is reached, release the button.

GROUP OPERATION

All motors in the system can also be controlled and operated as a group from the master switch. To activate the lift function, momentarily depress (less than one second) the desired direction on the master switch. During this action, the motors

can be stopped in any position by pressing the STOP button. To tilt the window treatment, simply press and hold either directional button. When the desired angle is reached, release the button.
